Clifford involutions following Hitzer and Sangwine

Robin K. S. Hankin

02/09/2020

Clifford inverses

Hitzer and Sangwine set up a number of involutions which I reproduce for convenience below. Given $M \in Cl(p,q)$ and

$$M = \langle M \rangle_0 + \langle M \rangle_1 + \langle M \rangle_2 + \dots + \langle M \rangle_0$$

we have a number of involutions, documented at involutions.Rd:

- The main grade involution $\widehat{M} = \sum_{k=0}^{n} (-1)^k \langle M \rangle_k$ gradeinv(M)
- Reversion $\widetilde{M} = \sum_{k=0}^{n} (-1)^{k(k-1)/2} \langle M \rangle_k$ rev(M)
- Clifford conjugation $\overline{M} = \sum_{k=0}^{n} (-1)^{k(k+1)/2} \langle M \rangle_k$ cliffconj(M)
- Grade specific maps $m_{\overline{j},\overline{k}}(M)=M-2\left(\langle M\rangle_j+\langle M\rangle_k\right)$ neg(M)
- The generalised grade specific map $m_A(M) = M \sum_{i \in A} \langle M \rangle i$ neg(M)

H&S assert that

$$\overline{M} = \widehat{\widetilde{M}} = \widehat{\widetilde{M}} = \sum_{k=0}^{n} (-1)^{k(k+1)/2} \langle M \rangle_k$$

which we may verify numerically:

library(clifford)

```
(M <- rcliff())

## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms

## Element of a Clifford algebra, equal to
## + 4 - 3e_1 - 3e_14 + 3e_25 + 2e_36 + 4e_1246 + 1e_346 + 5e_1456

a1 <- cliffconj(M)
a2 <- gradeinv(rev(M))
a3 <- rev(gradeinv(M))
is.zero(a2-a1) & is.zero(a3-a1)</pre>
```

[1] TRUE

p + q = 3, three-dimensional vector spaces.

We now consider the case p+q=3. If $x\in Cl(p,q)$ with p+q=3 then equation 6.2 asserts that $x\overline{x}=r_0+r_3e_1e_2e_3$ for some $r_0,r_3\in\mathbb{R}$:

```
(x \leftarrow rcliff(d=3,g=3))
## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
## Element of a Clifford algebra, equal to
## + 6 - 3e_12 + 5e_3 + 7e_123
x*cliffconj(x)
## Element of a Clifford algebra, equal to
## - 29 + 114e_123
and equation 6.3 asserts that x\overline{x}(x\overline{x})^{\sim} \in \mathbb{R}:
f <- function(x){</pre>
    jj <- x*cliffconj(x)</pre>
    is.real(jj*rev(jj))
signature(0,3)
f(rcliff(d=3,g=3))
## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
## [1] TRUE
signature(1,2)
f(rcliff(d=3,g=3))
## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
## [1] TRUE
signature(2,1)
f(rcliff(d=3,g=3))
## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
## [1] TRUE
signature(3,0)
f(rcliff(d=3,g=3))
## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
## [1] TRUE
Thus equation 6.5, which asserts that the right inverse x_r^{-1} is
```

$$x_r^{-1} = \frac{\overline{x}\hat{x}\tilde{x}}{x\overline{x}\hat{x}\tilde{x}}, \qquad xx_r^{-1} = 1$$

```
RI3 <- function(x){ # right inverse
    jj <- cliffconj(x)*gradeinv(x)*rev(x)
    return(jj/drop(x*jj))
}
a <- 5+rcliff(d=3,g=3)

## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
a

## Element of a Clifford algebra, equal to
## + 11 + 2e_1 + 7e_123

RI3(a)

## Element of a Clifford algebra, equal to
## + 0.0644319 - 0.004798871e_1 + 0.01086803e_23 - 0.04297812e_123

zap(a*RI3(a))

## [1] 1

zap(RI3(a)*a)</pre>
```

[1] 1

Now equations 7.7 and 7.8, which assert that if $x\overline{x}m_{\overline{3}}/(x\overline{x})$ is nonzero, we have

$$x_r^{-1} = \frac{\overline{x} m_{\overline{3}, \overline{4}}(x\overline{x})}{x\overline{x} m_{\overline{3}, \overline{4}}(x\overline{x})}, \qquad x x_r^{-1} = 1$$

and

$$x_l^{-1} = \frac{\overline{x} m_{\overline{3},\overline{4}}(x\overline{x})}{\overline{x} m_{\overline{3},\overline{4}}(x\overline{x})x}, \qquad x_l^{-1} x = 1$$

Numerical verification:

```
f77 <- function(x){
    jj <- cliffconj(x)*neg(x*cliffconj(x),3:4)
    return(jj/drop(x*jj))
}

f78 <- function(x){
    jj <- neg(cliffconj(x)*x,3:4)*cliffconj(x)
    return(jj/drop(jj*x))
}

a <- 3 + rcliff(d=4)

## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
a

## Element of a Clifford algebra, equal to
## + 7 + 5e_23 + 4e_4 - 3e_24 - 2e_124 + 1e_134 + 4e_1234</pre>
```

```
f77(a)

Just to be explicit, the following DOES NOT WORK:
a <- rcliff()
a*f77(a) # (denominator not real)
```

The case $p+q \le 5$

Right inverse

Equation 8.21 asserts that, if $p + q \le 5$ then $z = x\overline{x}\hat{x}\tilde{x}m_{\overline{1},\overline{4}}(x\overline{x}\hat{x}\tilde{x}) \in \mathbb{R}$. Equation 8.22 asserts that, if z is nonzero, then

$$x_r^{-1} = \frac{\overline{x}\hat{x}\tilde{x}m_{\overline{1},\overline{4}}(x\overline{x}\hat{x}\tilde{x})}{x\overline{x}\hat{x}\tilde{x}m_{\overline{1},\overline{4}}(x\overline{x}\hat{x}\tilde{x})}, xx_r^{-1} = 1.$$

```
f822 <- function(x){
    jj <- cliffconj(x)*gradeinv(x)*rev(x)</pre>
    jj \leftarrow jj*neg(x*jj,c(1L,4L))
    jj/drop(zap(x*jj))
}
a \leftarrow 7+clifford(list(1,3,5,1:2,c(1,5),c(3,4),1:3,2:4,c(2,3,5),1:4,2:5,c(1,2,3,5),1:5),1:13)
## Element of a Clifford algebra, equal to

```

Left inverse

Similarly, equation 8.23 asserts that, if $p+q \leq 5$ then $z'=m_{\overline{1},\overline{4}}(\tilde{x}\hat{x}\overline{x}x)\tilde{x}\hat{x}\overline{x}x \in \mathbb{R}$. And if $z'\neq 0$ equation 8.24 asserts that

$$x_l^{-1} = \frac{m_{\overline{1},\overline{4}}(\tilde{x}\hat{x}\overline{x}x)\tilde{x}\hat{x}\overline{x}}{m_{\overline{1},\overline{4}}(\tilde{x}\hat{x}\overline{x}x)\tilde{x}\hat{x}\overline{x}x}, \qquad x_l^{-1}x = 1.$$

The R idiom would be

```
f824 <- function(x){ # left inverse
    jj <- rev(x)*gradeinv(x)*cliffconj(x)
    jj <- neg(jj*x,c(1L,4L))*jj
    jj/drop(zap(jj*x))
}</pre>
```

Check:

```
zap(f824(x)*x)
```

[1] 1

```
zap(f822(x)*x)
```

[1] 1

It turns out that the left and right inverses coincide:

```
signature(0,5)
Mod(f822(x) - f824(x))
```

[1] 0

```
signature(1,4)
Mod(f822(x) - f824(x))
## [1] 0
signature(2,3)
Mod(f822(x) - f824(x))
## [1] 0
signature(3,2)
Mod(f822(x) - f824(x))
## [1] 0
signature(4,1)
Mod(f822(x) - f824(x))
## [1] 0
```

Cartan isomorphism

We will carry out Cartan's isomorphism from Cl(p,q) to Cl(p-4,q+4) numerically. Here we specify p+q=7by calling rcliff() with argument d=7, and force p=4 by executing signature(4):

```
a <- rcliff(d=7)
                  # Cl(4,3)
## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
b <- rcliff(d=7) # Cl(4,3)
## Warning in clifford(replicate(n, sort(sample(d, f())), simplify = FALSE), :
## repeated element in terms
signature(4,3)
                   # e1^2 = e2^2 = e3^2 = e4^2 = +1; e5^2 = ... = -1
ab <- a*b
                   # multiplication in Cl(4,3)
signature(0,7)
                 # e1^2 = \dots = -1
cartan(a)*cartan(b) == cartan(ab) # multiplication in Cl(0,7)
## [1] TRUE
and again using cartan_inverse():
cartan_inverse(cartan(a) * cartan(b)) == ab # precalculated product!
## [1] TRUE
Now try mapping Cl(5,2) \longrightarrow Cl(1,7):
signature(5,2); ab_sig5 <- a*b</pre>
signature(1,7)
cartan(a,2) * cartan(b,2) == cartan(ab_sig5,2)
## [1] TRUE
cartan_inverse(cartan(a,2) * cartan(b,2),2) == ab_sig5
## [1] TRUE
```
